Career Objective

To apply and grow my skills in software and mobile application development within a professional tech environment. A 4th-year BSIT student with hands-on experience building Android applications, web-based e-commerce systems, and desktop software through capstone and coursework projects, comfortable working across the stack from Kotlin/Android and PHP/MySQL backends to front-end HTML, CSS, and JavaScript.

Education

2023 – present **Bachelor of Science in Information Technology**
New Era University (NEU), 9 Central Avenue, New Era, Quezon City, Philippines, 1107
4th Year, expected graduation 2026/2027

Projects

SeniorGuard – Guardian-Linked Scam Intervention System Capstone Project, 2026
Android app · Kotlin · Firebase & Supabase

- Built an Android application that protects elderly users from scams through SMS monitoring, accessibility-based scam detection, and link/QR code scanning.
- Designed a guardian–elder "family circle" system so relatives can be alerted to suspicious activity in real time.
- Led the migration of the backend from Firebase to Supabase, resolving authentication and database issues along the way.

TerraBuy – Computer Parts & Peripherals E-Commerce System Systems Analysis & Design Project
System analysis and design · UML modeling

- Analyzed and designed an e-commerce management system for computer parts and peripherals, focused on product browsing, cart management, and secure checkout.
- Produced Use Case Diagrams and HIPO (Hierarchical Input-Process-Output) charts to model system requirements and structure.

Habibiy Store – Online Computer & Cellphone Parts Sales System Group Project
PHP · MySQL · HTML/CSS/JavaScript · OOP

- Developed an object-oriented e-commerce platform with product search, wishlist, cart, and checkout features.
- Applied core OOP principles (encapsulation, inheritance, polymorphism, abstraction) across the PHP class structure.

NeoHub Entertainment – Media & Entertainment Desktop App Group Project
Python (PyQt5)

- Built a desktop entertainment hub with music playback, a trivia game, and a movie browser/video player, complete with login and registration.

Final Project in Data Structures & Algorithms Group Project
Java · Trees · Graphs · Priority Queues

- Built three Java programs applying core data structures to real-world problems: a menu-driven utility program (arrays), a binary expression tree calculator, and a graph-based delivery route optimizer.
- Implemented Dijkstra's algorithm and BFS for route finding, with array- and heap-based priority queues for urgency-based package handling.

Barangay Incident Reporting System Personal Project
barangay-incident-reporting-system-two.vercel.app

- Built and deployed a web app for residents to report and track local incidents.

Latifah Boutique Website Personal Project
latifah.my-style.in

- Designed and built a storefront website for a personal boutique brand.

IT Skills

Languages: Java, Python, Kotlin, PHP, JavaScript, HTML5, CSS, SQL, Bash

Databases / Backend: MySQL, Firebase, Supabase, IBM SQL

Tools & Practices: Git & GitHub, Object-Oriented Programming (OOP), UML Modeling, Android App Development, UI/UX Prototyping
